Received 19 March 2010; accepted 29 March 2010

Key indicators: single-crystal X-ray study; $T=120 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.025 ; w R$ factor $=0.068$; data-to-parameter ratio $=13.6$.

In the title compound, $\mathrm{C}_{10} \mathrm{H}_{14} \mathrm{ClN}_{5}$, the imidazole and pyrimidine rings are essentially planar [maximum deviation $=0.0013$ (14) and 0.0207 (13) A, respectively]. In the crystal, the molecules are linked by weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ interactions into chains parallel to the $c$ axis and the crystal packing is stabilized by additional weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{Cl}$ interactions.

## Related literature

The title compound was prepared according to a modification of the procedure of Fiorini \& Abel (1998). For the synthesis and/or biological activity of related compounds, see: Legraverend \& Grierson (2006). For related structures, see: Kubicki \& Codding (2001); Trávníček \& Popa (2007); Rouchal et al. (2009a,b,c).

## Comment

The heterocyclic system, imidazo[4,5-d] pyrimidine, commonly known as purine, was first named by Emil Fisher at the turn of the $19^{\text {th }}$ century. A large number of variously substituted purines exhibit a wide range of biological activities (Legraverend \& Grierson, 2006). They act as interferon inducers, adenosine receptor ligands, inhibitors of microtubule assembly, protein kinases, sulfotransferases and phosphodiesterases. The title molecule was prepared as a part of our research into the synthesis of novel trisubstituted purines.

The asymmetric unit of the title compound consists of a single purine molecule. Both imidazole and pyrimidine rings are nearly planar with maximum deviations from the mean plane being 0.0013 (14) $\AA$ for C 4 (imidazole ring) and 0.0207 (13) $\AA$ for C2 (pyrimidine ring). Both carbon atoms of the dimethylamino substituent lie essentially in the pyrimidine mean plane as demonstrated by torsion angles C3-C2-N5-C7 and C3-C2—N5-C6, which are $4.3(2)^{\circ}$ and $175.90(13)^{\circ}$, respectively. The torsion angle describing the orientation of isopropyl and purine ring, $\mathrm{H} 8 \mathrm{~A}-\mathrm{C} 8-\mathrm{N} 4-\mathrm{C} 4$ is $-163.55(13)^{\circ}$. Molecules are linked into chains along the $c$ axis by weak $\mathrm{C} 4-\mathrm{H} 4 \cdots \mathrm{~N} 1$ interactions (Table 1, Fig. 2). Crystal packing is further stabilised by short $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{Cl}$ contacts (Table 1).

## Experimental

The title compound was prepared according to a slightly modified literature procedure (Fiorini \& Abel, 1998). 2,6-Dichloro-9-(propan-2-yl)-9H-purine ( $0.87 \mathrm{mmol}, 196 \mathrm{mg}$ ) and methylamine hydrochloride ( $0.91 \mathrm{mmol}, 61.5 \mathrm{mg}$ ) were dissolved in a mixture of DMF $(2.5 \mathrm{ml})$ and $N$-ethyl- $N$-isopropylpropan-2-amine $(1.74 \mathrm{mmol}, 225 \mathrm{mg})$. The resulting solution was stirred at $90^{\circ} \mathrm{C}$ for 2 hours. Subsequently, the mixture was diluted with water and extracted with diethyl ether. Combined organic layers were washed twice with brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Crude product consisting of two compounds with relative abundances of $43 \%$ and $57 \%$ according to GC were obtained after evaporation of the solvent in vacuum. The products were identified as $N$-methyl and $N, N$-dimethyl derivatives. Column chromatography (silica gel; petroleum ether/ethyl acetate, $\mathrm{v} / \mathrm{v}$, $1 / 1$ ) yielded the latter as a colourless crystalline powder ( $105 \mathrm{mg}, 54 \%, \mathrm{mp} 418-422 \mathrm{~K}$ ). The crystal used for data collection was grown by spontaneous evaporation from deuterochloroform at room temperature.

## Special details

Experimental. CrysAlis RED (Oxford Diffraction Ltd, 2009). Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.
Geometry. All esds (except the esd in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving 1.s. planes.

Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor wR and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$ factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
