Received 29 June 2012; accepted 15 August 2012

 Key indicators: single-crystal X-ray study;  $T = 120$  K; mean  $\sigma(\text{C}-\text{C}) = 0.002$  Å;  $R$  factor = 0.025;  $wR$  factor = 0.069; data-to-parameter ratio = 13.4.

In the title compound,  $\text{C}_{10}\text{H}_{14}\text{ClN}_5$ , the purine ring system is essentially planar, with an r.m.s. deviation from the least-squares plane defined by the nine constituent atoms of 0.0063 (11) Å. In the crystal, molecules are linked by weak  $\text{N}-\text{H}\cdots\text{N}$  and  $\text{C}-\text{H}\cdots\pi$  interactions.

**2-Chloro-*N*-ethyl-9-isopropyl-9*H*-purin-6-amine****Federico Andrés Giovagnoli, Michal Rouchal, Peter Bartoš and Robert Vícha****Comment**

The wide range of biological activities of di-, tri-, or tetrasubstituted purines is closely associated with essentially unlimited number of substituents that can be combined in the C2, C6, C8 and N9 positions of the purine ring (Legrauerend & Grierson, 2006). The title molecule has been prepared as a part of our ongoing study of novel 2,6,9-trisubstituted purine series (Rouchal *et al.*, 2009*a,b*, 2010). To the best of our knowledge, the title compound has not been described in the literature so far.

In the title molecule (Fig. 1), the purine unit is essentially planar, with a r.m.s. deviation of 0.0063 (11) Å from the least-squares plane defined by the nine constituent atoms. Although all pyrimidine atoms lie essentially in plane, the ring is markedly deformed from regular hexagon geometry with N1–C2–N3 angle of 132.0 (11)°. In the crystal structure (Fig. 2), molecules are connected by weak intermolecular N—H···N and C—H··· $\pi$  interactions (Table 1).

**Experimental**

The title compound was prepared according to slightly modified literature procedure (Fiorini & Abel, 1998). 2,6-Dichloro-9-isopropyl-9*H*-purine (100 mg, 0.43 mmol) and ethylamine hydrochloride (37 mg, 0.45 mmol) were dissolved in the mixture of DMF (3 cm<sup>3</sup>) and triethylamine (87 mg, 0.86 mmol). The resulting solution was stirred at 90 °C for 3 h. Subsequently, the mixture was diluted with water and extracted with ethyl acetate (6 × 10 cm<sup>3</sup>). Combined organic layers were washed twice with brine, dried over Na<sub>2</sub>SO<sub>4</sub> and evaporated in vacuum. Crystallization of the crude product from diethyl ether at room temperature provided desired compound as colorless crystals (67 mg, 65%, mp 390–393 K) suitable for X-ray diffraction analysis.

**Refinement**

All carbon bound H atoms were placed at calculated positions and were refined as riding with their  $U_{\text{iso}}$  set to either 1.2 $U_{\text{eq}}$  or 1.5 $U_{\text{eq}}$  (methyl) of the respective carrier atoms. The positions of methyl H atoms were optimized rotationally. Nitrogen bound H atom was located in a difference Fourier map and refined freely.

**Computing details**

Data collection: *CrysAlis CCD* (Oxford Diffraction, 2009); cell refinement: *CrysAlis RED* (Oxford Diffraction, 2009); data reduction: *CrysAlis RED* (Oxford Diffraction, 2009); program(s) used to solve structure: *SHELXS97* (Sheldrick, 2008); program(s) used to refine structure: *SHELXL97* (Sheldrick, 2008); molecular graphics: *ORTEP-3* (Farrugia, 1997) and Mercury (Macrae *et al.*, 2008); software used to prepare material for publication: *SHELXL97* (Sheldrick, 2008).

**Figure 1**

The molecular structure of the title compound with the atom numbering scheme. Displacement ellipsoids are drawn at the 50% probability level. H atoms are presented as small spheres of arbitrary radius.

**Figure 2**

A view of the N—H $\cdots$ N (black dotted lines) and C—H $\cdots$  $\pi$  (red dashed lines) interactions in the crystal structure of the title compound. H atoms non-participating in hydrogen-bonding were omitted for clarity. Symmetry codes: (i)  $-x, -y + 1, -z + 1$ ; (ii)  $-x + 0.5, y - 0.5, -z + 0.5$ .

Elemental analysis calc for C<sub>10</sub>H<sub>14</sub>ClN<sub>4</sub> (239.70) C 50.11, H 5.89, N 29.22; found C 50.16, H 5.92, N 29.02.

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.

*Hydrogen-bond geometry (Å, °)*

Cg1 is the center of gravity of the pyridine ring (C1, N1, C2, C3, C4, N2).

<i>D</i> —H $\cdots$ <i>A</i>	<i>D</i> —H	H $\cdots$ <i>A</i>	<i>D</i> $\cdots$ <i>A</i>	<i>D</i> —H $\cdots$ <i>A</i>
N3—H3 $\cdots$ N4 <sup>i</sup>	0.837 (16)	2.205 (17)	2.9979 (16)	158.2 (15)
C8—H8 $\cdots$ Cg1 <sup>ii</sup>	1.00 (1)	2.90 (1)	3.6403 (13)	131 (1)

Symmetry codes: (i)  $-x, -y+1, -z+1$ ; (ii)  $-x+1/2, y+1/2, -z+1/2$ .
